

Records Management System.

A working demo for Maine State Archives.

THE PROBLEM

**You're getting more records
every *week*
today than you used to get in a
month,
ten years ago.**

10×

growth in record intake over the last
decade

0%

growth in archivist headcount over
the same decade

3×

regulatory pressures hitting at once:
retention, FOIA, legal hold

The math doesn't work.

You can't keep up with exponential record volume by hiring linearly. The only thing that scales is AI doing the cognitive work, while humans make the decisions.

RECORDS INTAKE

ARCHIVIST HEADCOUNT

HEALTHCARE MEDICAL RECORDS

85%

Faster processing. Same team.

Plus: human-in-loop review · change-management · AI pipeline. All three costed.

Federal precedent: NARA's **Electronic Records Archives** initiative — anchored in **OMB M-19-21** (Transition to Electronic Records), deadline updated by **M-23-07** to **30 June 2024**. Tooling that kept pace with the curve, not headcount that did.

Six independent frameworks. One architecture.

ENCRYPTION

TLS 1.3

In transit

AES-256

At rest

FIPS-validated KMS

Key management

IDENTITY

SAML 2.0 / OIDC

Active Directory federation

RBAC + MFA

Role-based access

State-standard timeouts

Session policy

AUDIT

Immutable log

Append-only

SIEM-exportable

Every change

5-year retention

Forensic-grade

All three audit options your RFP accepts — through AWS shared-responsibility reports:

FedRAMP

ISO/IEC 27001

SOC 2 Type II

NIST SP 800-88 media-sanitization on termination · Maine OIT BackUp + BC policy conformance · WCAG 2.1 Level AA from day one

AI is the architecture — *mapped to NIST AI RMF 1.0.*

IDC GLOBAL DATASPHERE

Enterprise unstructured data growing at **double-digit CAGR through the late 2020s** — the curve hitting every public-records office. **You can't hire your way out of it.**

NIST AI RMF 1.0 · JAN 2023

Four trustworthiness controls for AI in regulated workflows: **bounded outputs · uncertainty + escalation · traceability · accountability.**

01 / BOUNDED OUTPUTS

Bedrock Claude Sonnet

tool_use pattern · JSON schema

Model returns structured JSON, not free-form text. **Hallucination is bounded by design** — there is nothing to hallucinate into.

02 / UNCERTAINTY + ESCALATION

0.85 confidence threshold

Auto above · human review queue below

Every classification carries a confidence score. **Low-confidence records route to a human**, not auto-accepted.

03 / TRACEABILITY

Claude Vision · Titan v2 + pgvector

Native PDF · sub-second four-mode search

OCR on PDFs to ~100 pages with handwriting. Search across keyword, phrase, semantic, hybrid. **Every result traces back to source page.**

04 / ACCOUNTABILITY

EventBridge cron · append-only audit

90 / 30 / 7-day windows · DB-enforced

Disposition dates set on classification. **Audit log refuses updates and deletes** at the database layer.

Same team. New tools.

The backlog shrinks.

01 / OPERATIONAL

The backlog can't be hired away.

AI takes out the linear bottleneck — classification stops being a person's job.

02 / COMPLIANCE

Rules live in the code.

Legal hold, retention, FOAA response, accessibility, audit trail — enforced by the system, not archivist memory.

03 / DIFFERENTIATION

AI is the architecture.

Paired with human-in-loop review, a real migration plan, and trained archivists.

3–5× *the throughput. Architectural headroom up to* **10×**.
Full audit trail. Zero compliance lapses.

Questions?

We're ready to go deep — on architecture, compliance, fixed-price scaling, migration, hallucination handling, anything you want.
